

## AI Assisted Coding LAB ASS-5.4

NAME: V.SATHWIK REDDY

BATCH:14

2303A510D7

### Task Description #1:

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

### PROMPT:

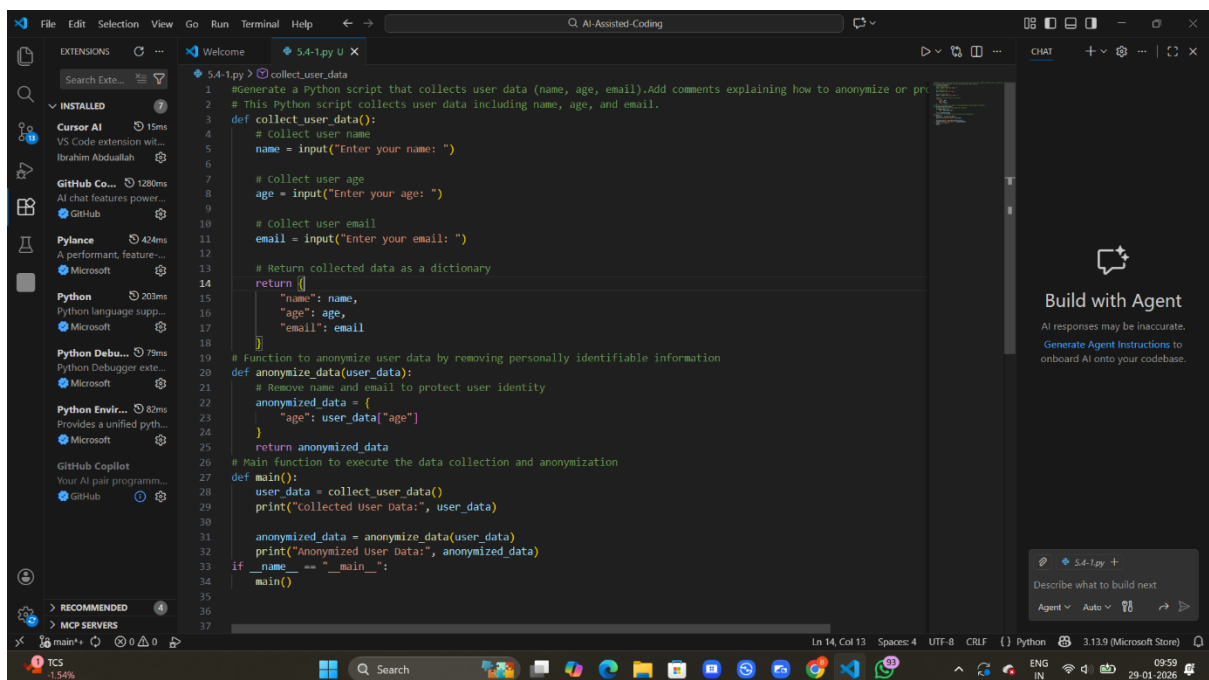

# Generate a Python script that collects user data such as name, age, and email.

# Add inline comments explaining how to protect or anonymize this data,

# such as hashing email addresses, avoiding plain-text storage,

# and following basic privacy best practices.

### CODE AND INPUT

```
1 generate a python script that collects user data (name, age, email).Add comments explaining how to anonymize or pr
2 # This Python script collects user data including name, age, and email.
3 def collect_user_data():
4     # collect user name
5     name = input("Enter your name: ")
6
7     # collect user age
8     age = input("Enter your age: ")
9
10    # collect user email
11    email = input("Enter your email: ")
12
13    # Return collected data as a dictionary
14    return {
15        "name": name,
16        "age": age,
17        "email": email
18    }
19
20 # Function to anonymize user data by removing personally identifiable information
21 def anonymize_data(user_data):
22     # Remove name and email to protect user identity
23     anonymized_data = {
24         "age": user_data["age"]
25     }
26     return anonymized_data
27
28 # Main function to execute the data collection and anonymization
29 def main():
30     user_data = collect_user_data()
31     print("collected User Data:", user_data)
32
33     anonymized_data = anonymize_data(user_data)
34     print("Anonymized User Data:", anonymized_data)
35
36 if __name__ == "__main__":
37     main()
```

Anonymized User Data: {'age': '21'}
PS C:\Users\sathw\Documents\AI-Assisted-Coding>
```

## Task Description #2:

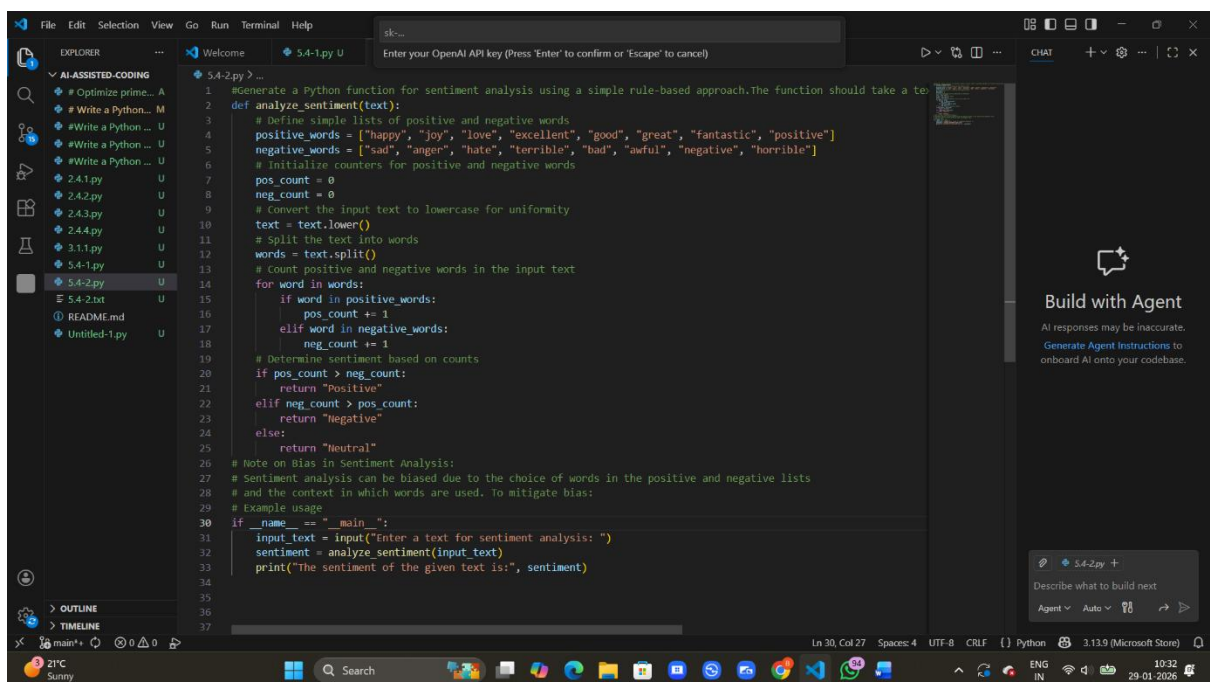

• Ask Copilot to generate a Python function for sentiment analysis. Then prompt Copilot to identify and handle potential biases in the data

PROMPT: # Generate a Python function for sentiment analysis.

# Add comments or code to identify and reduce potential biases in the data,

# such as removing offensive terms, balancing positive and negative samples,

# and avoiding biased language in predictions.

OUTLINE
TIMELINE

1 #Generate a Python function for sentiment analysis using a simple rule-based approach.The function should take a text
2 def analyze_sentiment(text):
3     # Define simple lists of positive and negative words
4     positive_words = ["happy", "joy", "love", "excellent", "good", "great", "fantastic", "positive"]
5     negative_words = ["sad", "anger", "hate", "terrible", "bad", "awful", "negative", "horrible"]
6     # Initialize counters for positive and negative words
7     pos_count = 0
8     neg_count = 0
9     # Convert the input text to lowercase for uniformity
10    text = text.lower()
11    # Split the text into words
12    words = text.split()
13    # Count positive and negative words in the input text
14    for word in words:
15        if word in positive_words:
16            pos_count += 1
17        elif word in negative_words:
18            neg_count += 1
19    # Determine sentiment based on counts
20    if pos_count > neg_count:
21        return "Positive"
22    elif neg_count > pos_count:
23        return "Negative"
24    else:
25        return "Neutral"
26    # Note on Bias in Sentiment Analysis:
27    # Sentiment analysis can be biased due to the choice of words in the positive and negative lists
28    # and the context in which words are used. To mitigate bias:
29    # Example usage
30    if __name__ == "__main__":
31        input_text = input("Enter a text for sentiment analysis: ")
32        sentiment = analyze_sentiment(input_text)
33        print("The sentiment of the given text is:", sentiment)

## Task Description #3:

- Use Copilot to write a Python program that recommends products based on user history. Ask it to follow ethical guidelines like transparency and fairness.

### PROMPT:

# Generate a Python program that recommends products based on user purchase history.

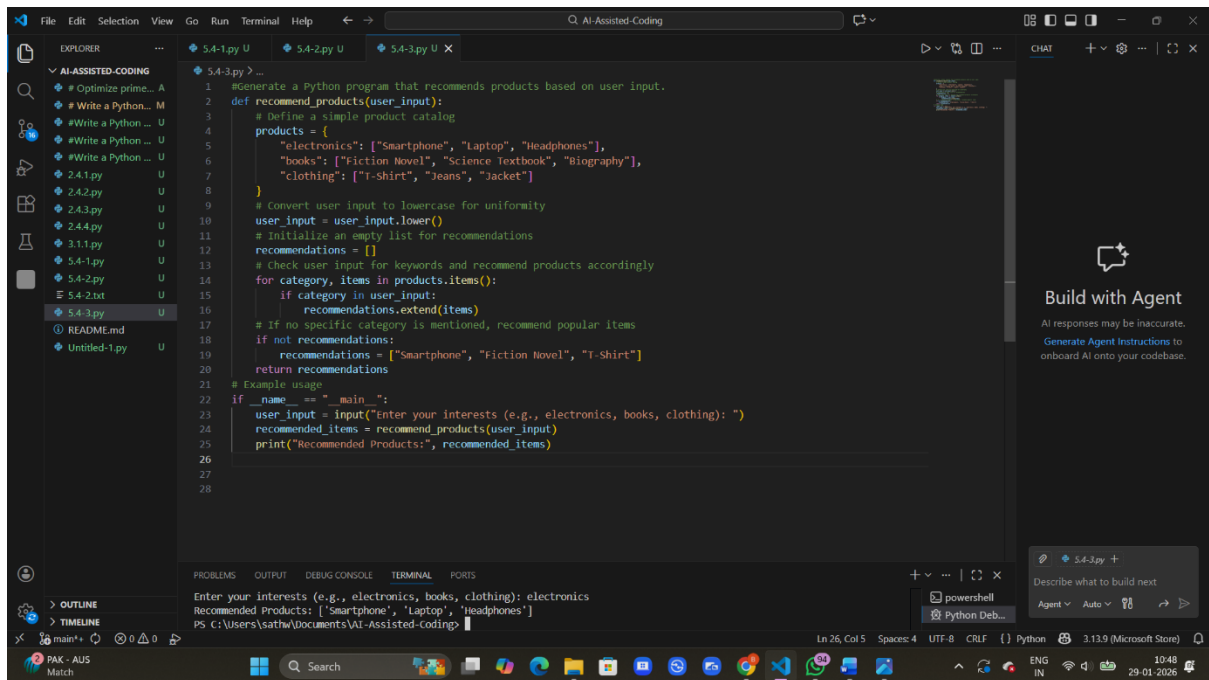

# Follow ethical AI guidelines such as transparency, fairness, and user control.

# Add comments explaining how recommendations are generated,

# Avoid favouritism toward only popular products,

# and allow users to give feedback or opt out of recommendations.

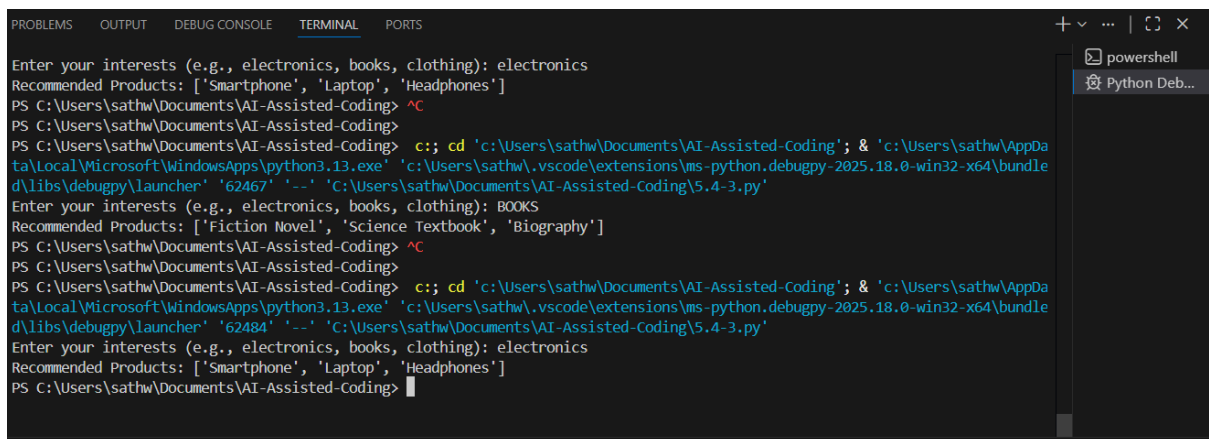

## CODE AND INPUT:

The screenshot shows the Visual Studio Code editor with a Python file named 5.4-3.py. The code is a Python program that recommends products based on user input. It defines a product catalog with categories like electronics, books, and clothing. The program takes user input, converts it to lowercase, and checks for keywords to recommend products. If no specific category is mentioned, it recommends popular items like 'Smartphone', 'Fiction Novel', and 'T-Shirt'. The program includes an example usage section and a main function that prompts the user for their interests and prints the recommended products.

```
1 #Generate a Python program that recommends products based on user input.
2 def recommend_products(user_input):
3     # Define a simple product catalog
4     products = {
5         "electronics": ["Smartphone", "Laptop", "Headphones"],
6         "books": ["Fiction Novel", "Science Textbook", "Biography"],
7         "clothing": ["T-Shirt", "Jeans", "Jacket"]
8     }
9     # Convert user input to lowercase for uniformity
10    user_input = user_input.lower()
11    # Initialize an empty list for recommendations
12    recommendations = []
13    # Check user input for keywords and recommend products accordingly
14    for category, items in products.items():
15        if category in user_input:
16            recommendations.extend(items)
17    # If no specific category is mentioned, recommend popular items
18    if not recommendations:
19        recommendations = ["Smartphone", "Fiction Novel", "T-Shirt"]
20    return recommendations
21 # Example usage
22 if __name__ == "__main__":
23     user_input = input("Enter your interests (e.g., electronics, books, clothing): ")
24     recommended_items = recommend_products(user_input)
25     print("Recommended Products:", recommended_items)
26
27
28
```

## OUTPUT:

The screenshot shows the Visual Studio Code terminal with the output of the Python script. The user enters 'electronics' and the program recommends 'Smartphone', 'Laptop', and 'Headphones'. The user then enters 'books' and the program recommends 'Fiction Novel', 'Science Textbook', and 'Biography'. The user enters 'electronics' again and the program recommends 'Smartphone', 'Laptop', and 'Headphones'.

```

## Task Description #4:

- Prompt Copilot to generate logging functionality in a Python web application. Then, ask it to ensure the logs do not record sensitive information.

## PROMPT:

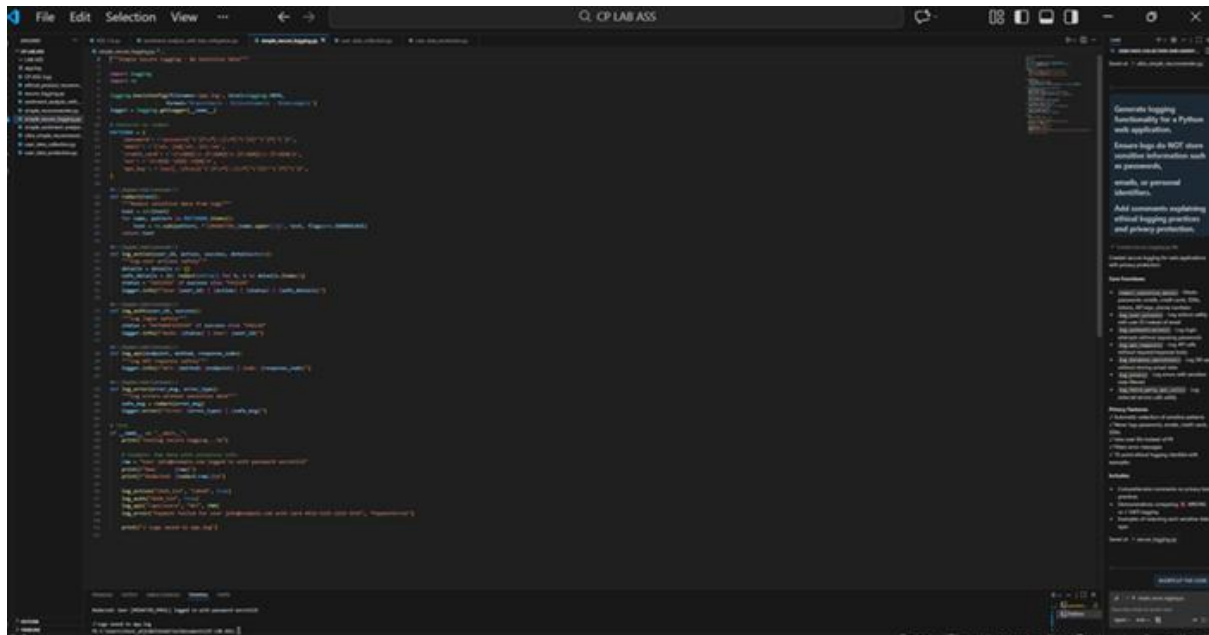

# Generate logging functionality for a Python web application.

# Ensure logs do NOT store sensitive information such as passwords,

# emails, or personal identifiers.

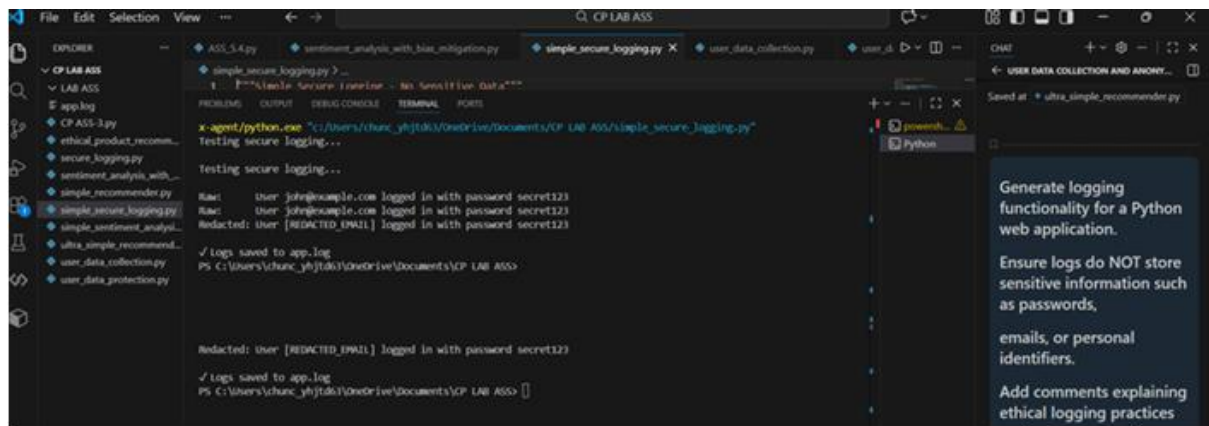

# Add comments explaining ethical logging practices and privacy protection.

## CODE AND INPUT:

The screenshot shows a code editor with a dark theme. The main window displays a Python script for secure logging. The code includes comments in Chinese and English, explaining the purpose of the script and the importance of secure logging. The script defines a function to log user login attempts, ensuring that sensitive information like passwords is not stored in the logs. The code is well-structured with clear comments and logical flow.

## OUTPUT:

The screenshot shows a terminal window with the output of the secure logging script. The output displays the results of a login attempt, showing the username, password, and the fact that the password was redacted. The terminal also shows the path to the log file and the command used to run the script. The output is clear and easy to read, providing a good example of how to use the script.

## Task Description #5:

- Ask Copilot to generate a machine learning model. Then, prompt it to add documentation on how to use the model responsibly (e.g., explainability, accuracy limits).

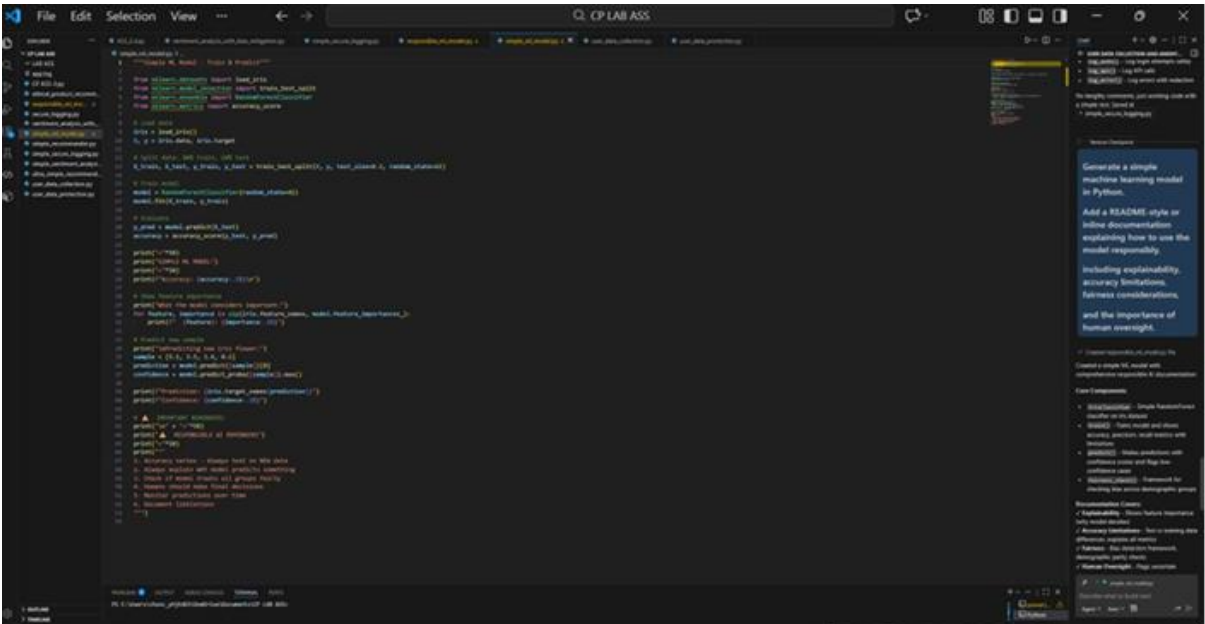

PROMPT: # Generate a simple machine learning model in Python.

# Add a README-style or inline documentation explaining how to use the model responsibly,

# including explainability, accuracy limitations, fairness considerations,

# and the importance of human oversight.

CODE AND INPUT:
